Stationary theory versus deterministic training (momentum 0.9, 250k steps, hidden lr 0.001, readout init var N_0/N^2, readout lr lr·N_0/N, embedding lr lr·N/N_0, $N_0 = 64$, seed 0)
f_C: readout-weighted compositional share; R: accessibility (cyan $R = 5/32$); φ_{out}: block-2 4+4→8 share of the readout-weighted $d8$ amplitude; dashed: theory H_C region
lower objective: per cell, the run with the lower final objective J (W = parent-warm, J = joint)
