Stationary theory versus Langevin-annealed training ($T_0 = 10^{-7}$, seed 0)

f_C: readout-weighted compositional share; R: accessibility (cyan $R = 1/\sqrt{8}$); φ_{out}: block-2 2+2→4 share of the readout-weighted $d4$ amplitude; dashed: theory H_C region
lower objective: per cell, the run with the lower final objective J (W = parent-warm, J = joint)
