Planted degree-4 circuit in the trained singleton solution: outcome after 50k post-intervention steps
final degree-4 pre-activation share
final objective L = MSE + (λ/2)Σ‖θ‖²
seed strength ρ
coherent seed (fill = outcome)
target-orthogonal control
repeat with another minibatch seed (small, slightly offset in ρ)
rescue: degree-4 solution
mixed / unresolved
decay: singleton solution
ring: outcome after a 150k-step continuation
predicted barrier ρ_crit = 0.2831
predicted singleton objective 0.20196
predicted degree-4 objective 0.03764
